Auto Typing program Tutorial

1. Download and install python from: www.python.org/downloads
2. Open up PowerShell or Command Prompt and write: "pip install pyautogui" so that the program can access your keyboard.
3. Create a file with the extension .py (you can use whatever text editor you wish) and execute using Python (program you installed with the link above).
4.

```
File   Edit   Format   Run   Options   Window   Help

import pyautogui
import time

time.sleep(10)
pyautogui.typewrite("1")
pyautogui.press('enter')
```

5. This is what a basic auto typing program will look like
   a. Import pyautogui – allows for the program to use your keyboard for typing
   b. Import time – allows for the program to take pauses for a certain amount of seconds
   c. Time.sleep(10) tells the program to wait 10 seconds before executing it
   d. Pyautogui.typwrite("") will write a physical letter that is placed between " and "
   e. Pyautogui.press('') will press a keyboard button like enter as shown above.
6. Make sure to click on the program that you want the program to start writing on.
